

ARTICLE TITLE

OPTIONAL SUBTITLE

First Last
September 4, 2026

Write the lead paragraph here. The lead is a short, self-contained paragraph in bold that gives the reader a quick overview of what the article is about, what the central argument is, and why it is interesting. Two to four sentences is usually about right. Citations are allowed here too [1].

Figure 1. This is a caption for a single-column figure. The text wraps automatically and is indented neatly below the label.

Table 1. An example of a tasteful table with `booktabs`. Vertical lines are avoided; horizontal lines are used sparingly (top, between header and data, bottom).

Quantity	Symbol	Value
Speed of light	c	2.998×10^8 m/s
Planck's constant	$\hbar$	1.055×10^{-34} Js
Elementary charge	e	1.602×10^{-19} C

1. Introduction

Write the introduction here. State the problem, give the necessary background, and end with a short overview of the article's structure if useful. Paragraphs are marked with indentation — not with extra line breaks.

2. Section Two

Mathematics is set inline as $E = mc^2$ or as numbered equations:

$$\hat{H}\psi = E\psi. \quad (1)$$

Refer to equations with (1) and to references with [1].

Refer to figures in the text: figure 1 shows an example. The placement argument `[t]` asks LaTeX to place the figure at the top of a column — the most common options are `t` (top), `b` (bottom), `h` (here if possible), and `p` (own page).

2.1. Subsection

Use subsections to structure longer sections.

3. Conclusion

Summarize the main results and feel free to point toward open questions or further work.
